Keep a daily log of your observations. It is suggested that you begin this activity by mid-April and continue until at least early June. Each evening during twilight, record stars and planets you can spot within 1-1/4 hours after sunset. When you see a star or planet, make a check mark in the appropriate column, or note the time you first see it. If you hear any sounds of nature, such as from birds, frogs, toads, or insects while you're out observing, list those too!

Date	Rigel	Pleiades	Aldebaran	Sirius	Betelgeuse	Procyon	Capella	Pollux	Mercury	Venus	Mars	Jupiter	Saturn	Sky condition	Sounds	Remarks

Continue making daily observations. Add the stars Regulus, Arcturus, Spica, Vega, Deneb, Altair, and Antares to your daily checklist.
